Our company

Advanced Addiction Treatments centre (TAVAD) is established since 1988. Our main objectives are the treatment of drug abuse and clinical research to develop new and more successful addiction treatments.

What we do?

In the last years, we have been developing clinical research to achieve a new opiate abuse treatment. In 1993, we presented in Seville a new procedure for under sedation opiate detoxification, Ultra Rapid Opiate Detoxification (UROD), with wide repercussion in social and professional fields. Throughout ten years, more than 1.700 patients have followed our treatment.

General Information About Treatments

Ultra rapid detoxification and neuroadaptation (DNA) involves a range of treatments on opiate, alcohol, cocaine and tranquillizers (benzodiazepine) addiction. These treatments have been developed by our own medical and psychological staff, and they imply the recovery of brain areas damaged by drug use. Moreover, DNA allows a detoxification without withdrawal syndrome and without craving, with a 100% success.

When DNA restores brain areas damaged by drugs, patients go through fundamental psychological changes. They experience an important improvement of consciousness, self-esteem and relationships. On the other hand, our treatment allows a quick transit from addiction to a drug-free life, as patients don't suffer withdrawal or craving and so they are highly motivated and participative in the process.

Clinical Research (New Treatments)

In clinical research field, we have developed three new treatments for alcohol, cocaine and tranquillizers addiction. All of them, as well as Ultra Rapid Opiate Detoxification (UROD), are based on neuronal activity regulation in those brain areas harmed by drug abuse. There is no suffering during treatment, so that brain physical recovery is completed in a short period of time.

With regard to our new alcohol abuse treatment, more than 82% of patients evaluated with a view to pre and post-treatment psychological and physical information, have successfully gone through the first twelve months after discharge. There is to be taken into account that 100% of patients finished detoxification period without problems related to withdrawal.

Patent

Granted for Ultra Rapid Opiate Detoxification (UROD) in the United States, with international coverage.

Alliances

Medical Technologies Evaluation Agency (AETS), dependent on Spanish Ministry of Health, works since 1997 with TAVAD, analyzing and evaluating our treatment programs and presenting them in scientific magazines and congresses. A research alliance is what TAVAD established with the most prestigious official research institution in Spain, the Consejo Superior de Investigaciones Científicas, dependent on Spanish Ministry of Science and Technology, through its Nutrition and Bromatology Institute.

TAVAD also has established training alliances with two major universities in Spain, Universidad Autónoma de Madrid and Universidad Complutense de Madrid, and with University San Pablo CEU, which allow us to consolidate the ongoing projects.
